# ***SportPort***<sup>TM</sup>

The ***easy to use***  
***super-flexible***  
portal cannula system  
that surgeons  
have been waiting for

# What makes **SportPort**<sup>™</sup> different?

Conventional cannulas can be easy to use, but limit instrument mobility. Rubbery ports can give mobility but can be hard to use.

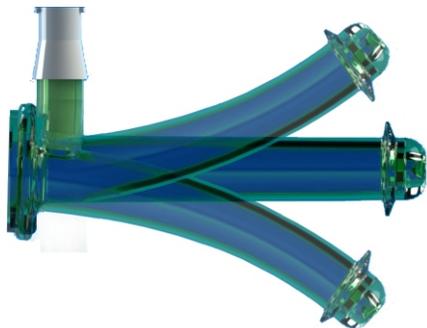

Cannuflow SportPort is the first and only elastomer port to combine high instrument mobility with the ease of use of a conventional smooth cannula with standard fluid management options!

## **Outstanding ease of use**

Other rubber cannula ports require deviating from the portal placement techniques surgeons already know. SportPort inserts just like a standard smooth cannula!

The patent pending DistalDrive system makes the SportPort as easy and intuitive to place as a rigid cannula and is compatible with the switching stick "railroading" techniques favored by many surgeons. It also features an inflow/outflow side port lacking in other rubber port designs.

## **Outstanding instrument mobility**

The SportPort is made of soft rubber, that allows superior instrument mobility in the shoulder compared to conventional rigid cannulas, and is specially designed to form a fluid tight seal around instruments to prevent squirting.

**SportPort: The new standard in flexible arthroscopic access**
